QI Review

QI Definition:
1. Qi is the fundamental substance constituting the universe. All universal changes are produced by the movement of qi.
2. Qi is the fundamental substance constituting the human body and maintaining the normal activities of the human body.
QI Formation:
1. The essence qi, inherited from the parents and stored in the kidney.
2. The water-food qi, derived through the transportation and transformation of the spleen.
3. The clear qi, the air drawn in through the lung.
QI Classification:
Ying qi (primary qi, original qi, essential qi):
Derived from congenital essence (Jing qi), and also need to be supplemented and nourished by the qi which is obtained after born from qi of water and food (Gu qi).
Distribution:
It takes root in the kidney and spreads to entire body via the sanjiao.
Function:
It is a fundamental force of vital activities and also is a basic substance of maintaining life.
Zong qi (pectoral qi, gathering qi):
It is formed by the combination of the clear qi (Qing qi) from the lung and qi of water and food (Gu qi) from the spleen and stomach.
Distribution:
It is located in the chest.

Function:
1. To promote the heart's function of controlling the blood and vessels. The circulation of qi and blood, coldness and warmth, and motor ability of the four limbs and trunk are all associated with zong qi.
2. To control the opening and closing the pores and readjust body temperature.
3. To warm and strengthen zang-fu muscles, skin and body hair.

QI Function:
1. Promoting function:
The growth and development of the human body, the physiological activities of the zang-fu and meridians, the circulation of the blood and distribution of body fluid, are all dependent on the promoting and stimulating effect of qi.
2. Warming function:
Qi is basic source of warm energy. The normal temperature of the body is maintained and readjusted by qi.
3. Defending function:
Qi defends the body surface against exogenous pathogenic factors.
4. Checking function:
Qi checks, controls and regulates certain bodily substance s and metabolic products.
5. Qi Hua function:

Western medicine's basic building block is the cell. The way to the energy transforms is through the concentration gradient (refer to AnP note for homeostasis for ATP and cellular respiration). Chinese medicine equivalent to energy is Qi. Qi moves within the channels.

Gu Qi is a source qi, whereas Ying qi is a final product.

Gu qi is the most important qi of all, because it's the material base for 4 different qi.

Zong Qi

- Heart
 - Controlling blood and vessels
 - Circulation of qi and blood, coldness and warmth
 - Motor ability of four limbs and trunk
- Lung
 - Control of respiration
 - Strength and weakness of speech

3. Defending function:
Qi defends the body surface against exogenous pathogenic factors.
4. Checking function:
Qi checks, controls and regulates certain bodily substance s and metabolic products.
5. Qi Hua function:

- SP - most important for the Qi formation
- LV - most important for the Qi movement (dynamic)

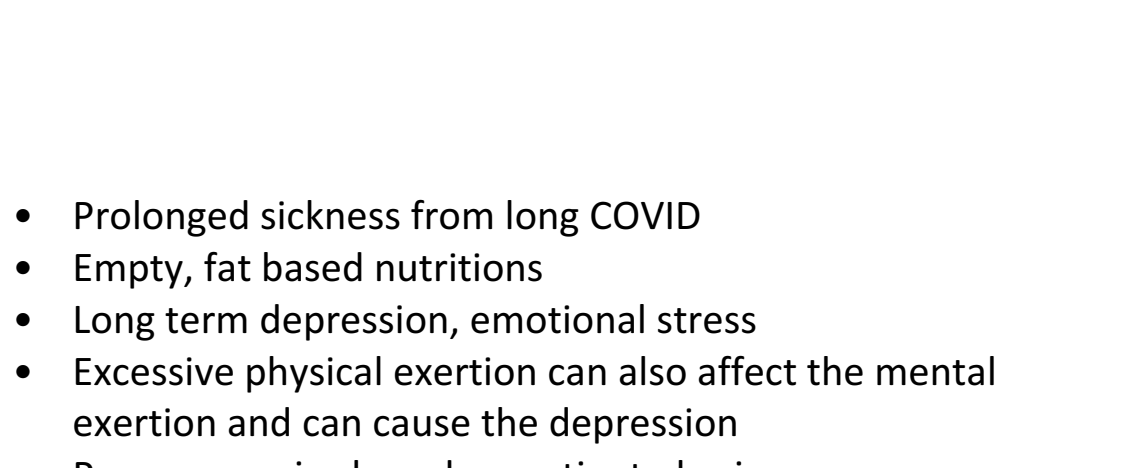

- Qi Ji is Qi dynamic, which occurs over time.
- Most important organ for qi movement is LIVER.
- Qi Hua is the transportation and transformation, which occurs in space.

Common balances of qi dynamic:

Right	LV wood - up	LU metal - down
Center	SP earth - up	ST earth - down
Left	HT fire - up	KI water - down

by nature, HT (fire) and KI (water) has to move the opposite direction

LU - HT Upper Balance
SP - ST Middle Balance
LV - KI Lower Balance

- Prolonged sickness from long COVID
- Empty, fat based nutrition
- Long term depression, emotional stress
- Excessive physical exertion can also affect the mental exertion and can cause the depression
- Proper exercise based on patient physiquis.

- Qi deficiency pale - a little bit shiny and puffy face due to the water retention
- When you wake up and feel tired but gets better after day's movement, it's due to the dampness, not qi deficiency.
- Low blood sugar can cause dizziness and spontaneous sweating.

- Mostly related to the chest and breathing because of the improper descending and dispersing function. Wei qi will be deficient and water will be accumulated in LU.
- Clear and thin phlegm is an indication of water retention due to the compromised Qi's dispersing function.

- Palpitation (Zong qi can affects the Heart's function)
- Shortness of breath
- Stifling sensation in the chest

- Material and function must coexist for life
- Function - Qi
- Materials - blood, jing, b.f.

HT shen related manifestations (consciousness, memory, thinking, sleep) is not listed here, because it's BLOOD DEFICIENCY, not Qi deficiency!

Qi is basic source of warm energy. The normal temperature of the body is maintained and readjusted by qi.
3. Defending function:
Qi defends the body surface against exogenous pathogenic factors.
4. Checking function:
Qi checks, controls and regulates certain bodily substance s and metabolic products.
5. Qi Hua function:

- Tongue and Pulse
- Tongue is a muscle and when qi is deficient, muscle becomes less elastic and hard to get back into a normal shape. Without swelling (a sign of water retention), you can still notice the teeth mark due to the qi deficiency. Refer to the BIG FIVE, this can support your diagnosis. This is only one of the signs.
- Thin, white coating is considered normal, teeth mark is the only abnormal sign.

- Treatments:
- Tonify Qi - Gu Qi
- Strengthens SP/ST because Gu Qi is the most important Qi and SP/ST is the source organ.

- Malfunctioning mitral valve allows back flow of blood into the left atrium, causing progressive enlargement.

Etiology of Qi sinking is a progression from Qi deficiency so it share the same etiology and should act in preventive measure.

Special Qi sinking signs:

- Internal organs prolapse
- Most common cases:
 - Anus
 - composed of smooth muscle
 - before and after menopause, long term diarrhea, long term distention, postpartum
 - Uterus
 - Postpartum after multiple childbirth
 - Kidneys
 - Right side is lower than left side because LV, appendix and GB are all located on the right side.
 - If it moves more than 2.5 cm will be considered prolapse.
 - sharp feeling in the abdomen

Three types of muscles

- Skeletal - upper part of the esophagus
- Smooth - stomach (stomach shouldn't drop below the umbilicus)
- Cardiac

Qi Sinking examples:

Malfunctioning mitral valve allows back flow of blood into the left atrium, causing progressive enlargement.

When it's prolapse, the flow of blood from the left atrium moving down to the left ventricle will be compromised.

Fertilized egg/embryo implantation failure (IVF) embryo fails to attach the uterus wall

- LV - always blood and yin def.
- excess in LU (stagnation) and yang
- LV is the last meridian/organ in the great heaven meridian circulation, and the LV also is the main organ to maintain the Qi circulation.
- The wood overacts the earth which means the LV always makes the Qi deficiency to the SP in five elements theory.
 - SP Qi def. is often caused by the overaction of the LV.
- We start with LU to build up the Qi and LV being the last in the meridian, so it can only have the stagnation, not deficiency.

ETiology of Qi sinking is a progression from Qi deficiency so it share the same etiology and should act in preventive measure.

- Qi Collapse
 - Shock in Western medicine perspective
 - starts with the chronic disease
 - in case of bleeding (great loss of blood)
 - External trauma
 - GI bleeding
 - Body fluid deficiency eventually causes the blood volume decrease
 - septic infection leading to septic shock
 - internal organ failure is the terminal stage - when qi collapse, qi doesn't move and no movement of qi will not move the blood circulation

- All the openings in the body opens, except for eyes when Qi collapses.
 - pale, moist tongue, even short
 - floating large pulse w/o root
 - micro and fading pulse (BP<90/60 mmHG)
 - No pulse (BP 0/0 mmHG)

- qi xu - qi sinking - qi collapse - death
 - bf escape w/o Wei qi - profuse sweating
 - exhaustion of LU qi - feeble breathing
 - failure of Wei qi - cold hand and feet
 - desertion of KI qi - incontinence

- Qi stagnation means Qi is damaged.
 - slow down also counts as the stagnation, not only the obstruction.
 - constant movements of pain and appear/disappear of distention or even large masses.

- how to differentiate external pathogen WIND and Qi stagnation?
 - WIND only reflects the movement
 - Pain is associated with the STAGNATION!

Qi Ji of LU is DOWN.

LU qi stagnation develops quickly to rebellion.

- LV qi ji
 - LV in charge of releasing egg in F; sperm ejaculation in M
 - LV qi stagnation 70% of it relates to metal aspects.

Wiry pulse - tense, long, and stable. felt clearly under raring levels of pressure and resembling the sensation of stretched violin string.

In excess of Qi - LV in deficiency of Qi - SP (because of Gu Qi)
